Synthetic SDD cross-layer export

Executive Summary

Synthetic database-backed export evidence; not provider-generated business output.

Summary

Synthetic export path verification.

Architecture

A bounded service workflow with explicit human approval.

Components

Studio, governed API integration, and the existing Delivery board.

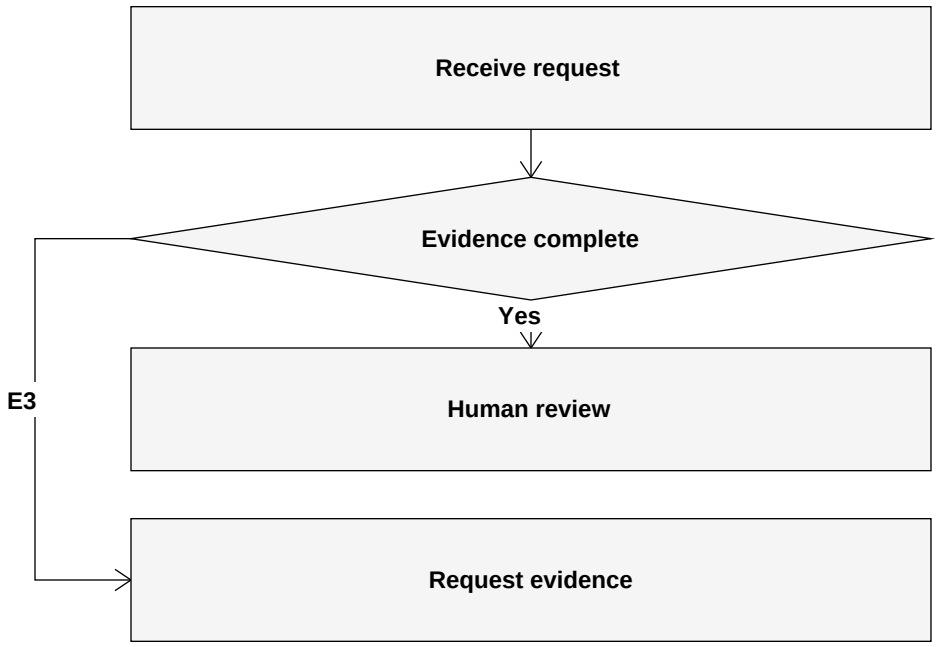
Interfaces

Read operations are distinct from unknown or prohibited write operations.

Data design

Source anchors and unresolved questions remain explicit.

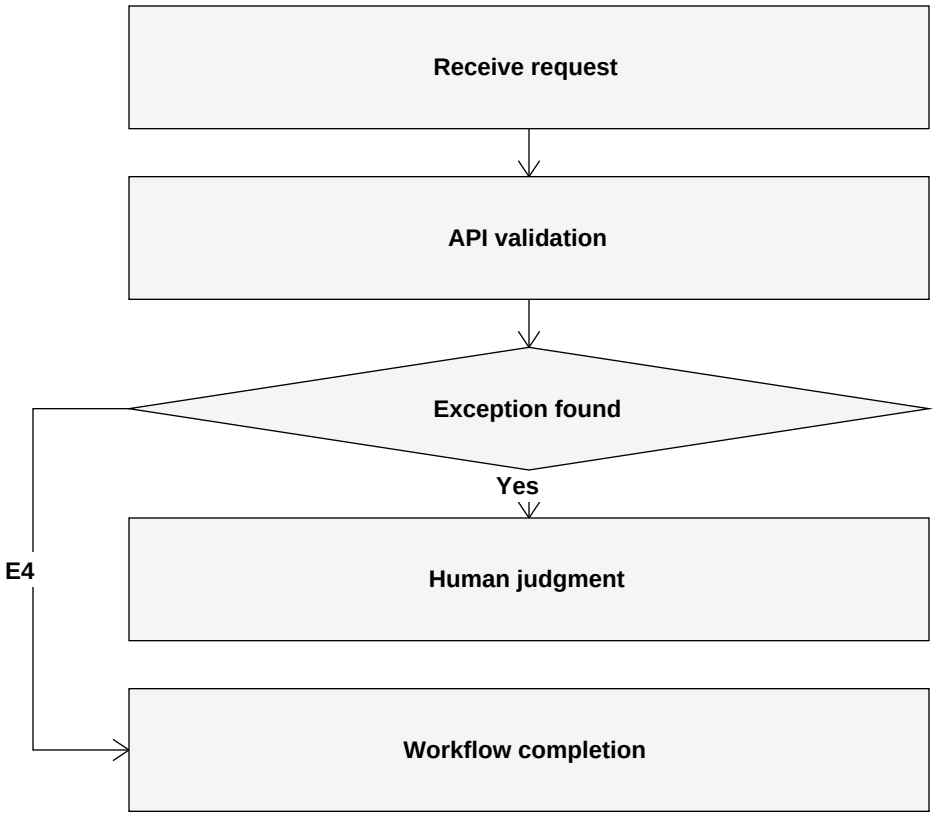
As is flow



Transition details

[A] Receive request - continue -> [B] Evidence complete
[B] Evidence complete - Yes -> [C] Human review
[B] Evidence complete - No -> [D] Request evidence

To be flow



Transition details

[A] Receive request - continue -> [B] API validation
[B] API validation - continue -> [C] Exception found
[C] Exception found - Yes -> [D] Human judgment
[C] Exception found - No -> [E] Workflow completion

Security controls

Server authorization, immutable lineage, and independent approval.

Operational design

Unresolved technical failures route to human review.

Design decisions

Use APIs and workflow where supported; AI remains optional unless selected.

Open questions and proposals

Confirm the write operation before technical approval.
