

The operating system for governed AI and automation decisions.

Evaluate before you automate. Govern before you execute.

EVIDENCE • HUMAN AUTHORITY • TRACEABLE HANDOFF

Enterprises have automation tools. They lack one governed decision path.

- Tool-first selection
- Fragmented assessment
- Missing evidence
- Inconsistent governance
- Handoff loss
- Weak outcome visibility

One business process is a portfolio of different work types.

Stable + structured	➡	Rules / workflow	Deterministic controls
Repetitive UI work	➡	RPA	Only where stronger interfaces are unavailable
Unstructured content	➡	AI assistance	Extraction, classification, summarisation
Context-heavy inquiry	➡	Bounded agent assistance	Evidence synthesis with controls
Material-risk judgment	➡	Human / HITL	Accountable approval
Mixed end-to-end work	➡	Hybrid model	A governed combination

The decision path crosses categories that stop at their own boundary.

AvalaOS governs the connective path; authorized systems execute.

AvalaOS carries evidence into delivery without losing authority.

The synthetic AP Invoice Exception journey proves the product model end to end.

01 Assess

Evidence-qualified recommendation

02 Govern

Human-owned controls

03 Studio

Approved artifacts

04 Delivery

Source-linked work

05 Monitor

Outcome visibility

Start where recurring automation decisions already exist.

- Automation and transformation consultancies
- Small and mid-sized enterprise AI / Automation CoEs
- Process Excellence teams
- Enterprise Architecture teams

LAND + EXPAND

- Land with one high-value process
- Expand to multiple processes
- Add portfolio and application context

The wedge expands along the same governed context.

CURRENT

- Process assessment
- Decision intelligence
- Governed review
- BRD / FRD / PDD
- Application modernization assessment

NEAR TERM

- Delivery lineage authority
- Monitor / Admin / Trust server models
- Controlled deployment
- Design-partner pilot

VISION

- Reusable solution patterns
- Governed software assembly
- Company-owned applications

Defensibility grows from context that survives every stage.

- 
- Versioned deterministic logic
 - Primitive-level operating models
 - Claim-linked evidence and assumptions
 - Human authority for material risk
 - Immutable review and artifact ancestry
 - Cross-module application and economics context

A services-assisted license can land the platform before recurring hosting.

Initial strategy

- Upfront enterprise or white-label license
- Implementation and enablement
- Paid customisation and enhancements
- Optional support and update agreement

Future strategy

- Hosted enterprise offering
- BYOK and provider controls
- Recurring tiers after deployment and pilot readiness

Founder-led assessments create the first route to repeatable distribution.

Product proof is ahead of commercial proof — and the boundary is explicit.

ACCEPTED SOURCE / CI

- Tenant authority + Assess
- V2 review and Govern handoff
- Economics + Application Portfolio
- Studio BRD / FRD / PDD

PRODUCT SURFACES

- Delivery workbench
- Monitor overview
- Admin / Trust
- Public enterprise UI

CANDIDATE / AHEAD

- Studio private artifacts
- Delivery lineage authority
- Monitor / Admin / Trust server models
- Deployment + pilot controls

The roadmap converts source proof into controlled commercial proof.

CURRENT

- Assess + Govern
- Application Portfolio
- Studio structured artifacts
- Source-level controls + UI

NEAR TERM

- Accept Studio PR B
- Delivery / Monitor / Admin / Trust authority
- Deployment-backed BYOK
- Controlled pilot

EXPANSION

- Reusable solution blocks
- Governed integration patterns
- Solution blueprints
- Company-owned applications

From deciding what to build to governing how software is assembled.

Assess

Evidence

Validate

Controls

Assemble

Reusable blocks

Launch

Governed handoff

Audit

Evidence + visibility

Forms • Workflows • Extraction • Validations • Approvals • Connectors • Reporting • Later-approved agent tools

ROADMAP VISION — NOT A CURRENT APPLICATION-GENERATION CAPABILITY

Capital would convert product proof into controlled market proof.

Deployment-backed
BYOK

Operational and pilot
